Cosmological Relativity: The Special and General Theories for the Structure of the Universe Moshe Carmeli

The theory presented in this book is a combination of Einstein's original special and general relativity, but now the starting point is not the propagation of light but the expansion of the Universe. The traditional Hubble constant H_0 (which is not constant) is called in this book the Hubble parameter. Its value at low gravity is denoted by h , and its reciprocal is denoted by τ . Thus τ is the Big Bang time (some authors call it the Hubble-Carmeli constant). This is actually the only constant that appears in this theory, just as c is the only constant that appears in Einstein's theory. There is no cosmological constant but there is a critical mass density. The theory presents general relativity in the space-velocity (of the receding galaxies) which is later on extended to include the time dimension. So far all experimental findings are satisfied by this theory.
